

Adobe Premiere

These are important procedures for creating and editing Adobe Premiere video projects on the library's Mac workstations:

1. Put all video assets (photos, graphics and raw video clips) into a folder on your external drive.

2. When setting up the video project for the first time in Premiere, make sure your project file is saved into the video assets folder created on your external drive (step 1).

Important: Make sure that any additional assets created during the editing process are put into the same folder created in step 1.
